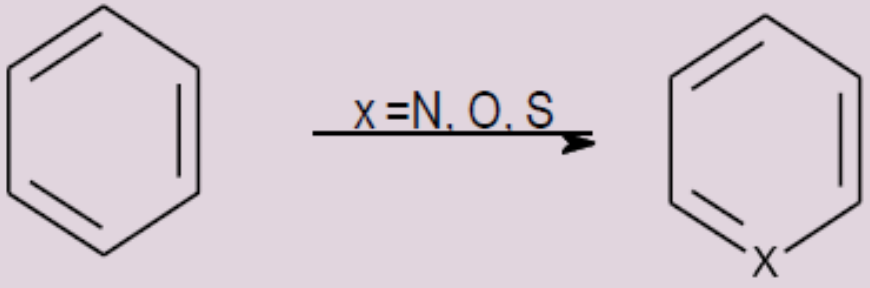
What's aheterocyclic compound?

If the ring system is made up of carbon atoms and at least one other element, the compound can be classified as hetero cyclic.

The elements that are found most commonly together with carbon in a ring system are Nitrogen (N), Oxygen(O), and Sulfur(S).



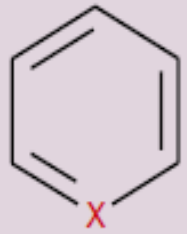
Heterocyclic Chemistry

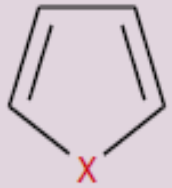
Heterocyclic compounds
are organic compounds that contain a ring structure containing atoms in addition to carbon, such as sulfur, oxygen or nitrogen, as the heteroatom.

Heterocyclic classification

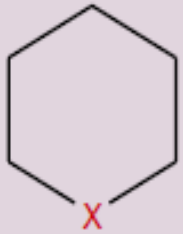
It can be classified into

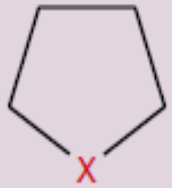
Heterocyclic compounds





Heteroaromatic

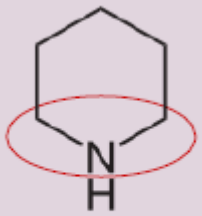




Heteroalicyclic

1- Heteroalicyclic or aliphatic heterocyclic

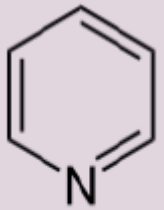
Oxirane



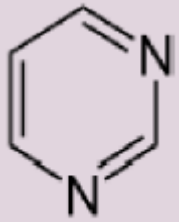
Piperidine

2- Aromatic heterocyclic :

A- Six-membered heteroaromatic compounds :

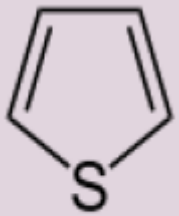


Pyridine



Pyrimidine

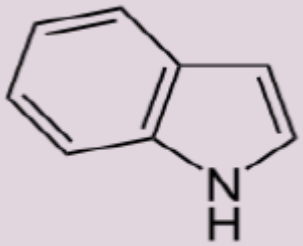
B- Five-membered heteroaromatic compounds :



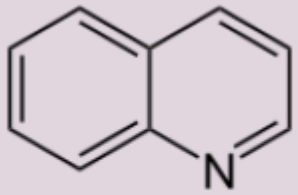
Thiophen

Furan

C- Bicyclic heteroaromatic compounds :

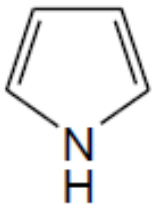


Indol

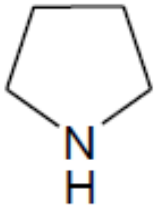


Quinoline

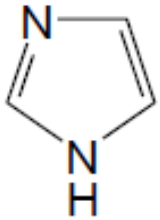
Survey of the most important heterocycles



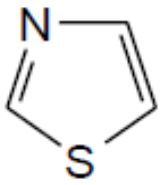
pyrrole



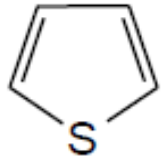
pyrrolidine



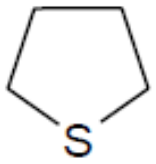
imidazole



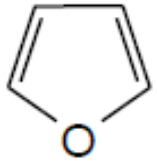
thiazole



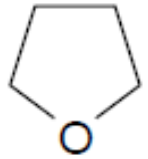
thiofene



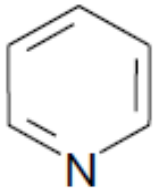
thiolane



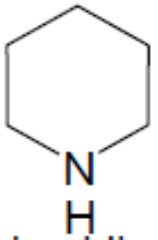
furan



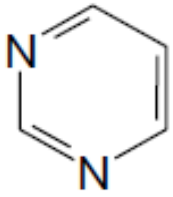
tetrahydro-furan



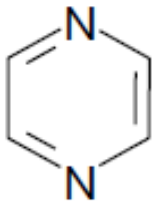
pyridine



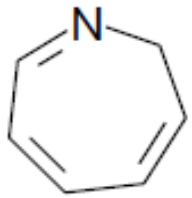
piperidine



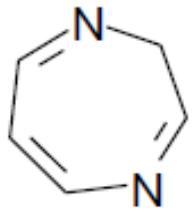
pyrimidine



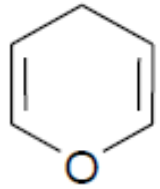
pyrazine



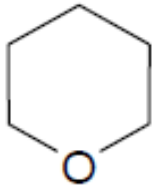
azepine



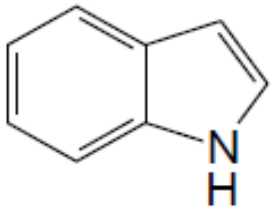
1,4-diazepine



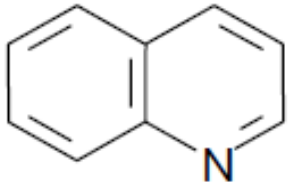
4H-pyran



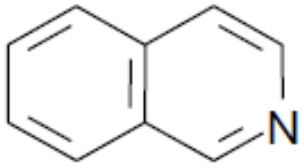
tetrahydro-pyran



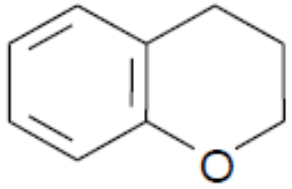
indole



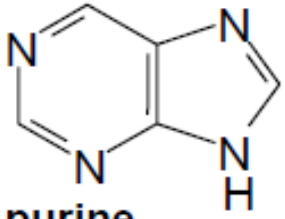
quinoline



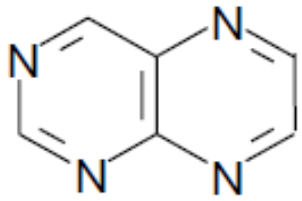
isoquinoline



chroman

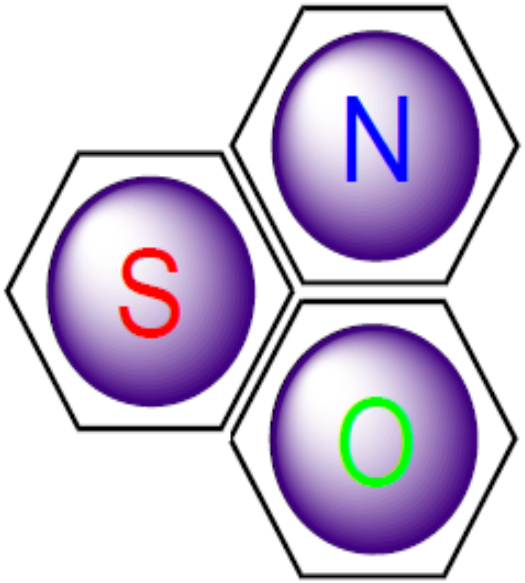


purine



pteridine

Heterocyclic Chemistry



Nomenclature of Heterocyclic compounds

Nomenclature of heterocyclic compounds

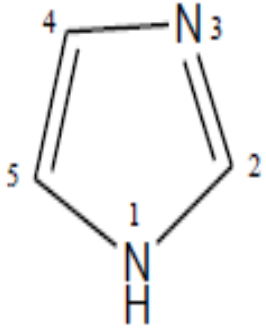
- Three systems for naming heterocylic compounds:

1- Common name
2- Replacement method
3- IUPAC or systematic method

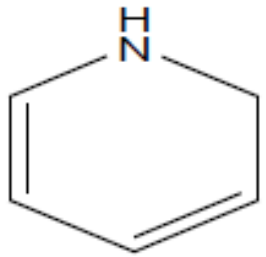
I- Common Nomenclature

❖ Each compound is given the corresponding trivial name. This usually originates from the compounds occurrence, its first preparation or its special properties.

❖ If there is more than one hetroatom of the same type numbering starts at the saturated one, e.g. imidazole.

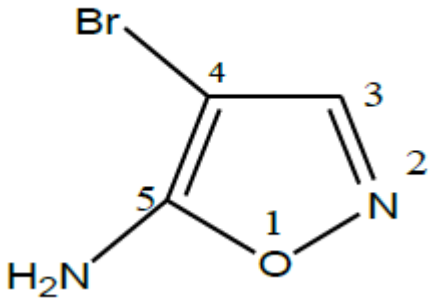


❖ The words dihydro, or trihydro, or tetrahydro are used if two or three or four atoms are saturated. These words are preceded by numbers indicate the position of saturated atoms as low as possible and followed by the corresponding fully unsaturated trivial name.

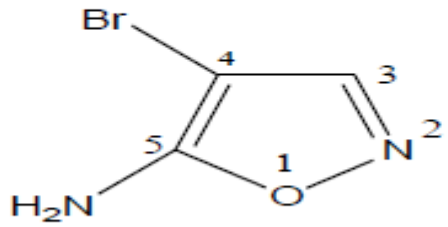


1,2-Dihydro-pyridine

❖ If there is more than one type of the heteroatoms, the ring is numbered starting at the hetroatom of the higher priority (O>S>N) and it continues in the direction to give the other hetroatoms the lower numbers as possible.



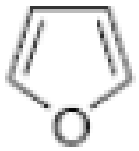
If subsituents present, their position should be identified by the number of the atoms bearing them and then they should be listed in alphabetical order.



5-Amino-4-bromoisoxazole

Trivial names

1) 5-membered heterocycles with one or two heteroatoms



furan

thiophene

pyrrole

imidazole

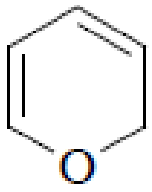
pyrazole

oxazole

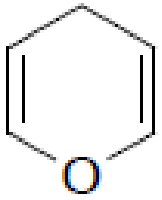
isoxazole

thiazole

2) 6-membered heterocycles with one or two heteroatoms



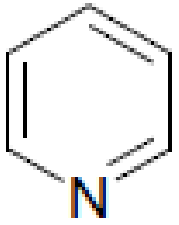
2H-Pyran



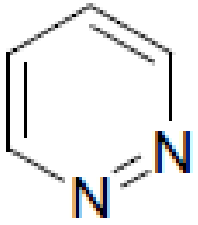
4H-Pyran

These are tautomers

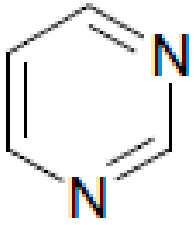
Both are not aromatic



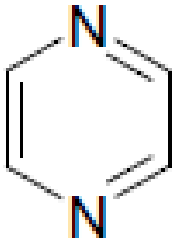
Pyridine



Pyridazine

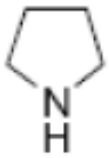


Pyrimidine

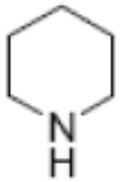


Pyrazine

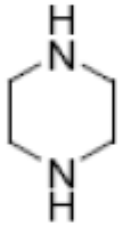
4) Saturated heterocycles



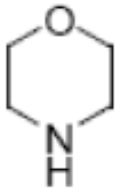
pyrrolidine



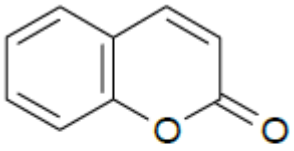
piperidine



piperazine



morpholine



Coumarine
Chromen-2-one

II- Replacement nomenclature

- Heterocycle's name is composed of the corresponding carbocycle's name and an elemental prefix for the heteroatom introduced (if more than one heteroatom is present they should be listed according to the priority order shown in (table 1).

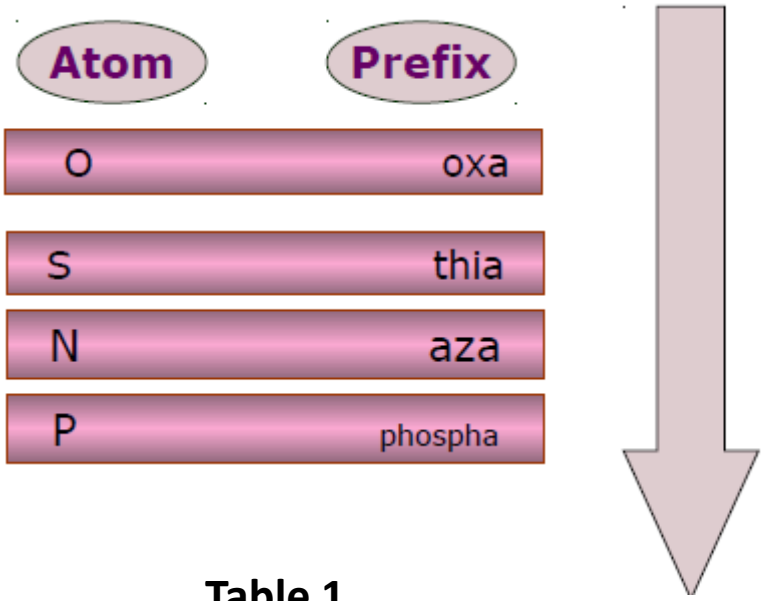


Table 1

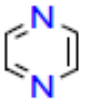
Replacement methods

Benzene

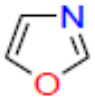


1,4-Diazabenzene

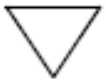
Cyclopentadiene

Oxacyclopenta-2,4-diene

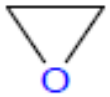
Cyclopentadiene



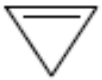
1-Oxa-3-azacyclopenta-2,4-diene



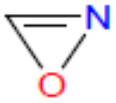
Cyclopropane



Oxacyclopropane

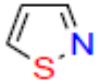


Cyclopropene



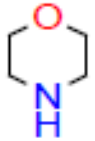
Oxazacyclopropene

Cyclopentadiene

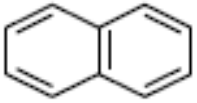


1-Thia-2-azacyclopenta-2,4-diene

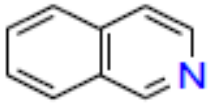
Cyclohexane



1-Oxa-4-azacyclohexane



Naphthalene



2-Azanaphthalene

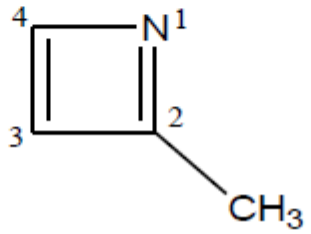
IUPAC method

1) **Identify the heteroatom present in the ring and choose from the corresponding prefix.**

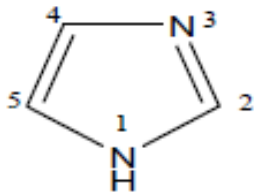
e.g. thia for sulpher, aza for nitogen and oxa for oxygen.

2) The position of a single heteroatom control the numbering in a monocyclic compound. The heteroatom is always assigned position 1 and if substituents present are then counted around the ring in a manner so as to take the lowest possible numbers.

For example:



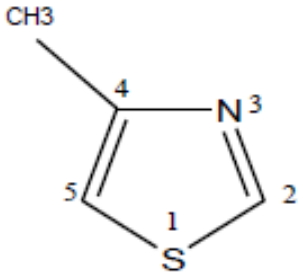
3) A multiplicative prefix (di, tri, ect.) and locants are used when two or more similar heteroatoms contained in the ring(two nitrogen indicated by diaza) and the numbering preferably commenced at a saturated rather than an unsaturated atom, as depicted in the following example: 1,3-diaza….



4) If more than one type of hetroatoms present in the ring the name will include more than one prefix with locants to indicate the relative position of the heteroatoms.

- When combining the prefixes (e.g. oxa and aza) two vowels may end up together, therefore the vowel on the end of the first part should be omitted (oxaza).

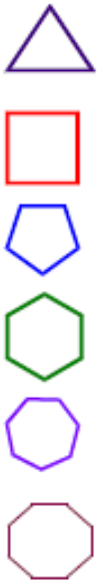
- The numbering is started from the heteroatom of the highest priority in such a way so as to give the smallest possible numbers to the other heteroatoms in the ring (the substituents are irrelevant). For example the prefix corresponding to the following compound is 4-Methyl-1,3-Thiaza….



5) Choose the appropriate suffix from (table 2) depending on whether or not nitrogen atom is present in the ring, the size of the ring and presence or absence of any double bonds

6) Combine the prefix(s) and suffix together and drop the first vowel if two vowels came together**.**

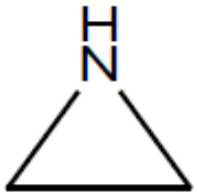
Table 2



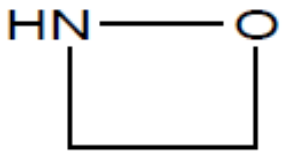
Ring size	N-present		N-absent	
	Unsat	sat	Unsat	sat
9	irine	iridine	irene	irane
10	ete	etidine	ete	etane
	ole	olidine	ole	olane
	ine	a	in	ane
	epine	a	epin	epane

a: means use the prefix perhydro followed by the fully unsaturated name

- Examples



- This ring contains (N) → Prefix is aza
- The ring is 3-membered and fully saturated → suffix is iridine
- By combining the prefix and suffix, two vowels ended up together (azairidine), therefore the vowel on the end of the first part should be dropped. This gives the correct name: **Aziridine**



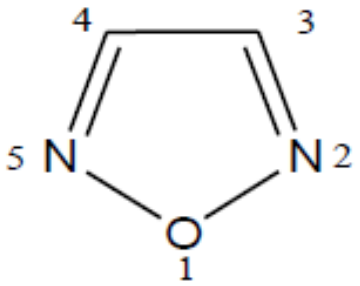
- This ring contains (O ,N) and (o) has higher priority than (N) and by starting numbering the ring at (O) → Prefix is 1,2-Oxaaza, but the first vowel must be omitted to give

  1,2-Oxaza

- The ring is 4-membered and fully saturated → suffix is etidine

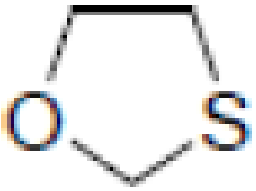
- By combining the prefix and suffix, two vowels ended up together (1,2-oaxazaetidine), therefore the vowel on the end of the first part should be dropped. This gives the correct name:

  1,2-oxazetidine

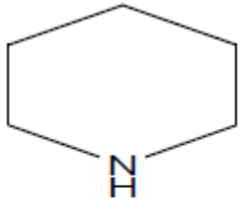


- This ring contains (O) → prfix1 (oxa), and two (N) → prfix2 diaza
- Locants, since (O) is higher priority than (N) so it is in position 1 by default and the two (N) are therefore at positions 2 and 5, this gives the combined prefixes as 1,2,5-oxadiaza (note that the a in oxa is not dropped)
- It is 5-membered,fully unsaturated ring with (N) → the suffix is ole
- By combining the prefixes and the suffix and dropping the appropriate vowels we get the correct name as

1,2,5-Oxadiazole



- This ring contains sulpher= thia-
- And oxygen = oxa-
- And saturated five-membered rings without nitrogen = –olane
- Oxygen is higher priority than sulpher, so it is in position 1.
- Drop the vowel in thia
- The name = 1,3-Oxathiolane

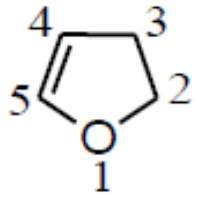


- The ring is 6-memberd, fully saturated with N ⟹ Prefix perhydro followed by the name of fully unsaturated 6-memberd ring with nitrogen ⟹ azine

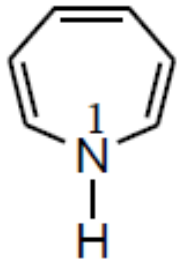
- Thus the full name is **perhydroazine**

❖ Partial unsaturation in heterocyclic compounds can be indicated by one of the following methods:

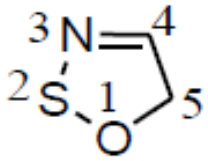
a) The position of nitrogen or carbon atoms which bear extra hydrogen atoms must be indicated by numbers and italic capital H (e.g. 1*H*, 2*H*, etc.) followed by the name of maximally unsaturated ring.



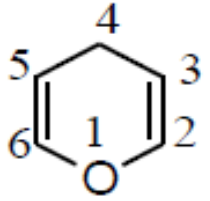
2*H*, 3*H*-Oxole



1*H*-Azepine

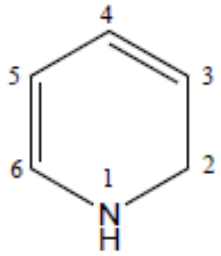


5*H*-1,2,3-Oxathiazole

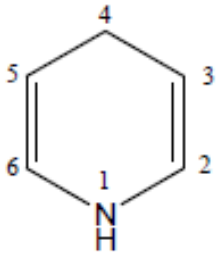


4*H*-Oxin

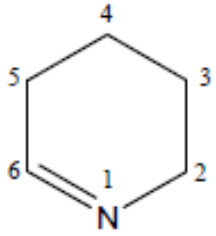
b) The words dihydro, or trihydro, or tetrahydro are used if two or three or four atoms are saturated. These words are preceded by numbers indicate the position of saturated atoms as low as possible and followed by the corresponding fully unsaturated Hantzsch-Widman name.



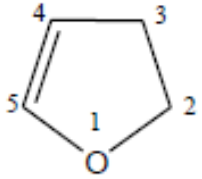
1,2-Dihydroazine



1,4-Dihydroazine



2,3,4,5-Tetrahydroazine

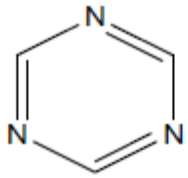


2,3-Dihydrooxole

- Exercise:

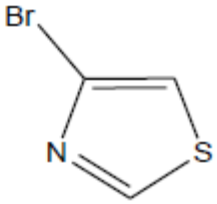
  Explain how can you name the following heterocycles.

1,3-Oxathiolane



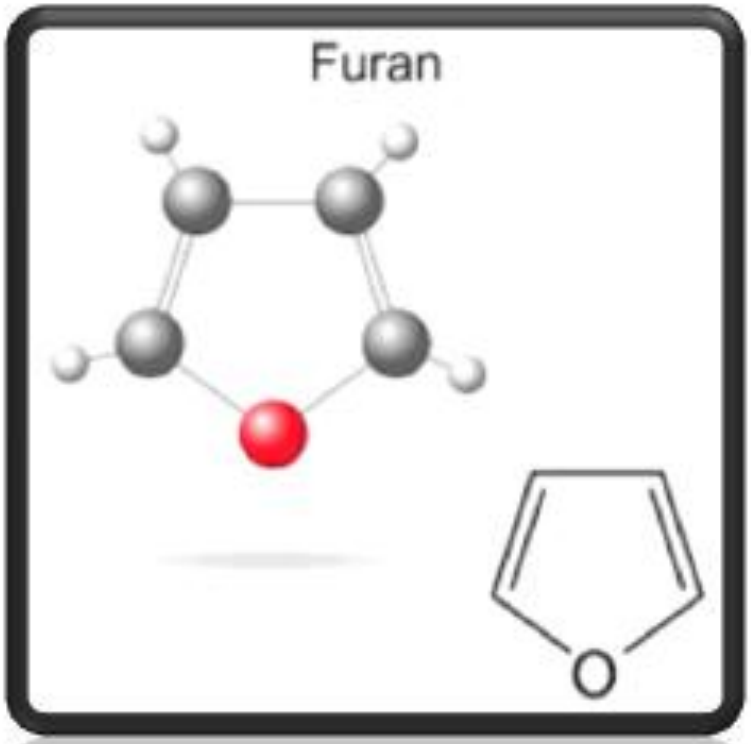
1,3,5 triazine

Oxirene



4 bromo 1,3 thiazole

Heterocyclic Compounds

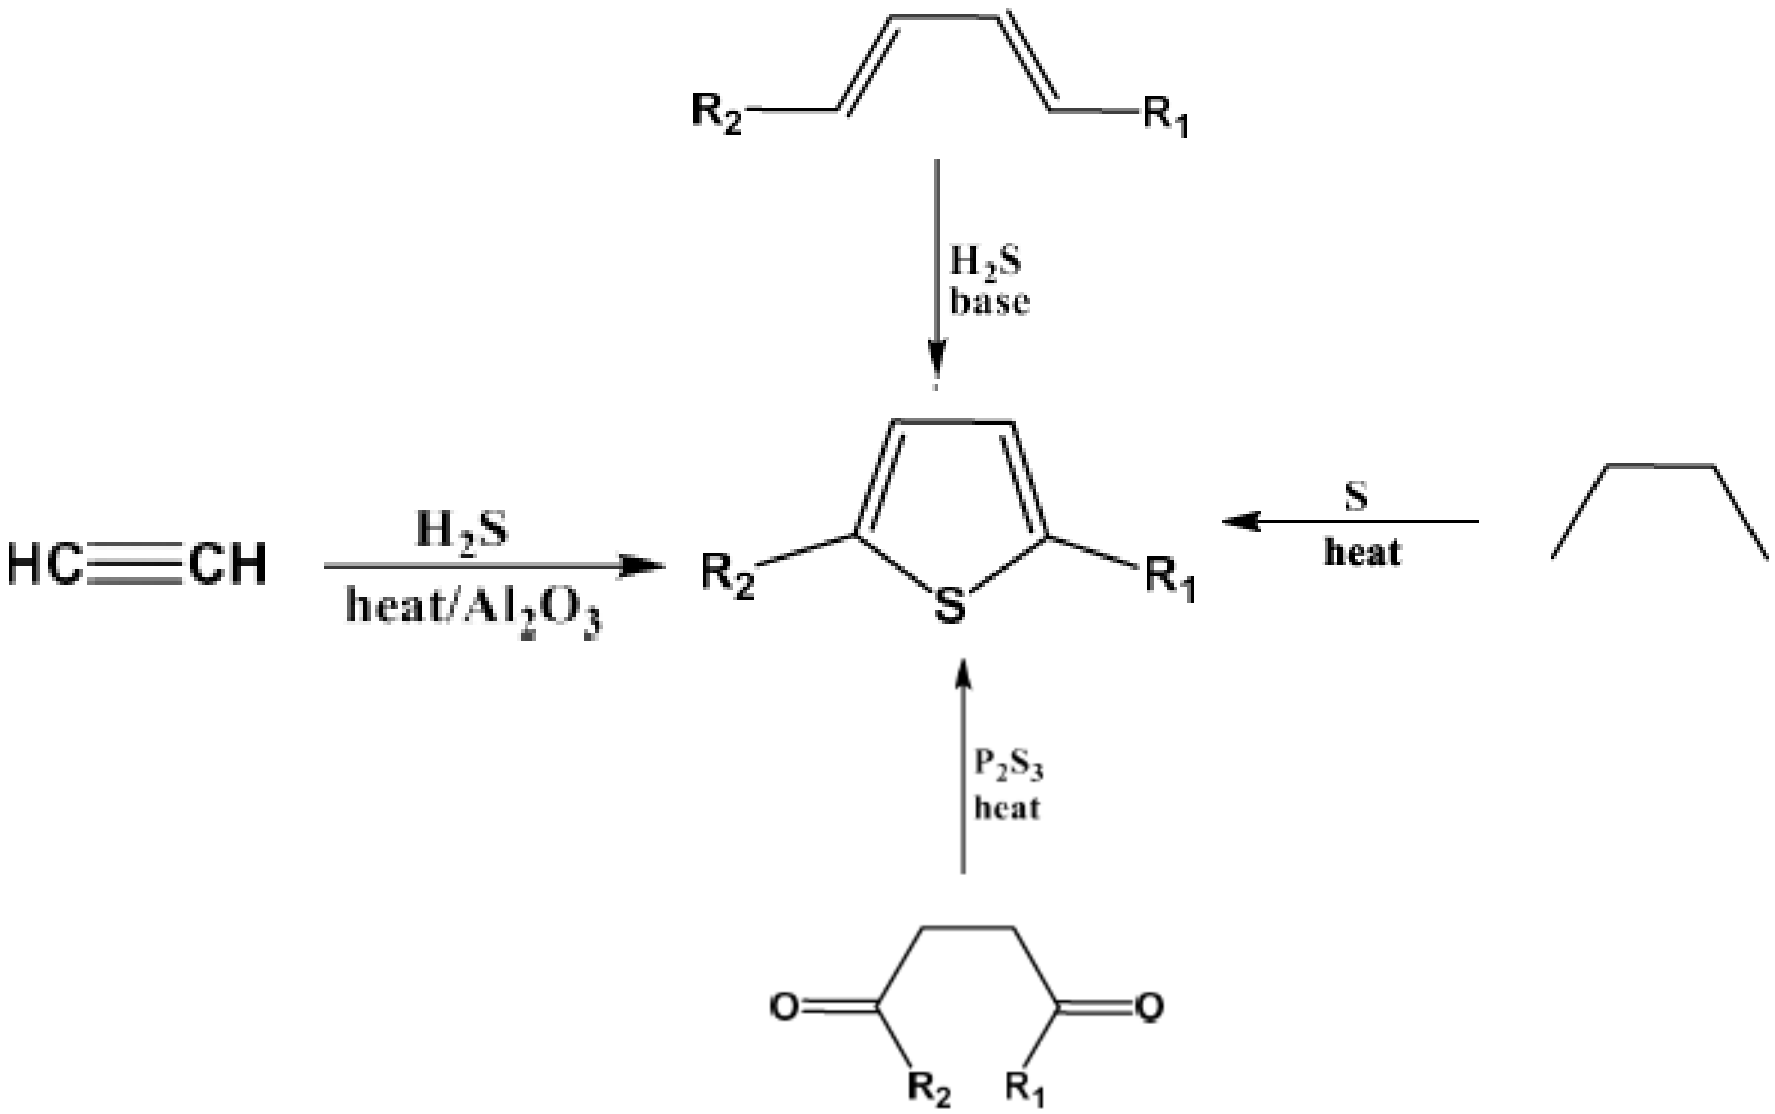


Physical properties

- **Furan may be as ethers but it is aromatic compoud because the lone pair of electrons on oxygen atom contribute in aromaticity.**
- **Furan has low melting point less than pyrrole because there's no hydrogen bonds.**
- **Furan is a liquid boiled at 31c and has odour as chloroform.**
- **Furan is springily soluble in water but it is miscible with most organic solvents.**

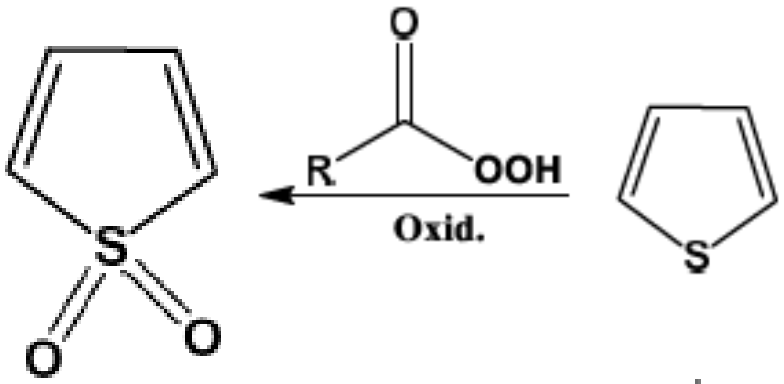
Thiophene

Preparation of thiophene

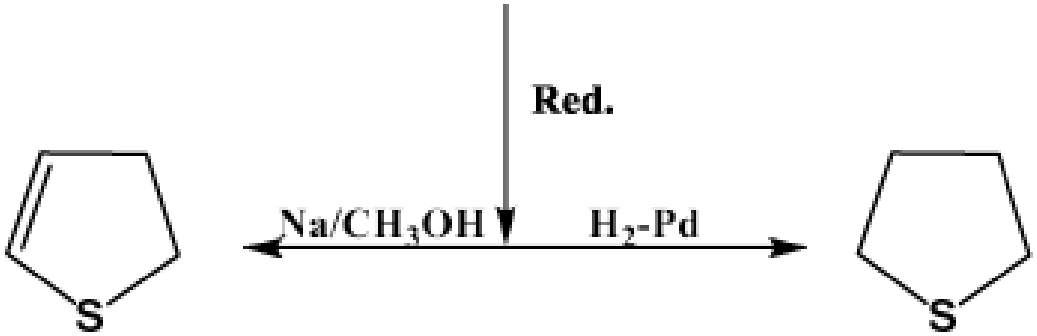


Reactions of thiophene

1-Oxidation reaction
2- reduction reaction

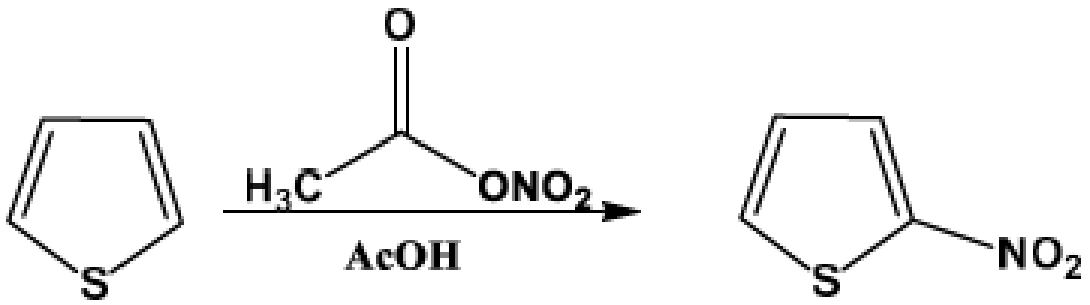


Thiophene-S,S-dioxide

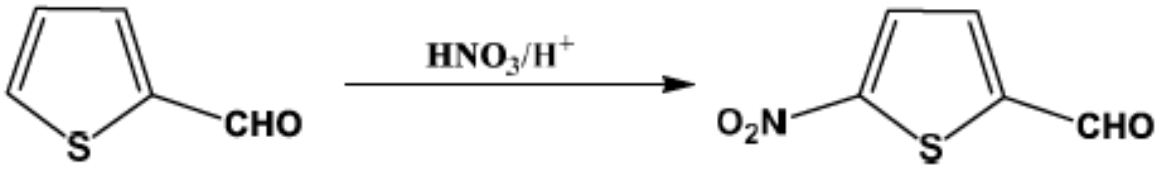


2H, 3H-Thiophene

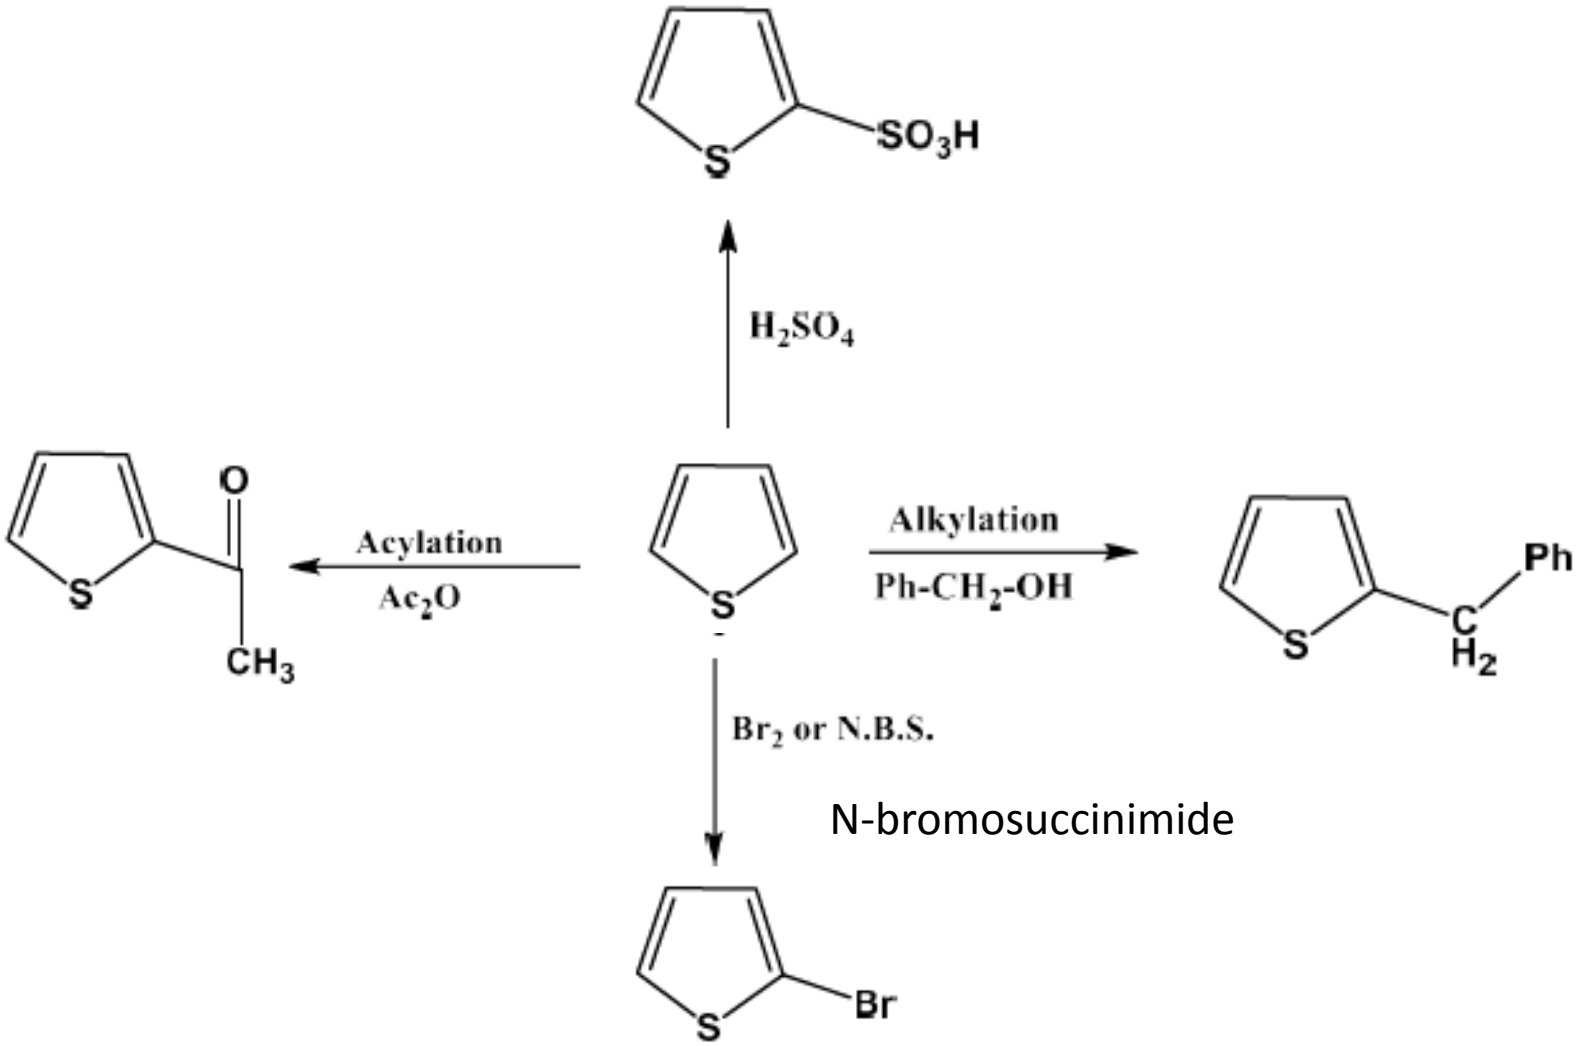
3- nitration reaction



Acetyl nitrate



Electrophilic substitution reactions:



N-bromosuccinimide

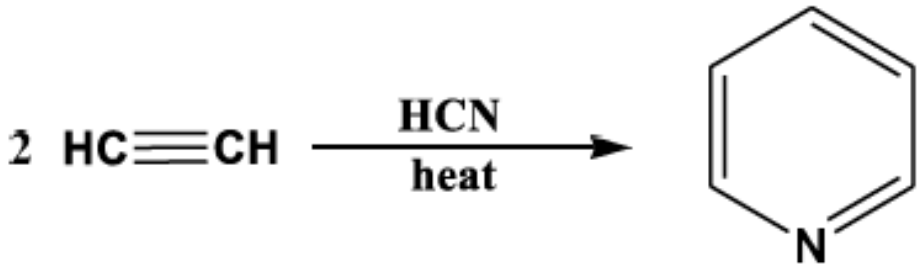
Physical properties

- In case of boiling point pyridine has less boiling point than pyrrole because the presence of hydrogen bonds in pyrrole.

- **But in case of basicity pyridine is more basic than pyrrole because the presence of free lone pairs of electrons on nitrogen atom, but in case of pyrrole the lone pairs of electrons contributed in aromaticity.**
- **Pyridine is used as a solvent in organic synthesis.**

Preparation of pyridine

1- from acetylene:

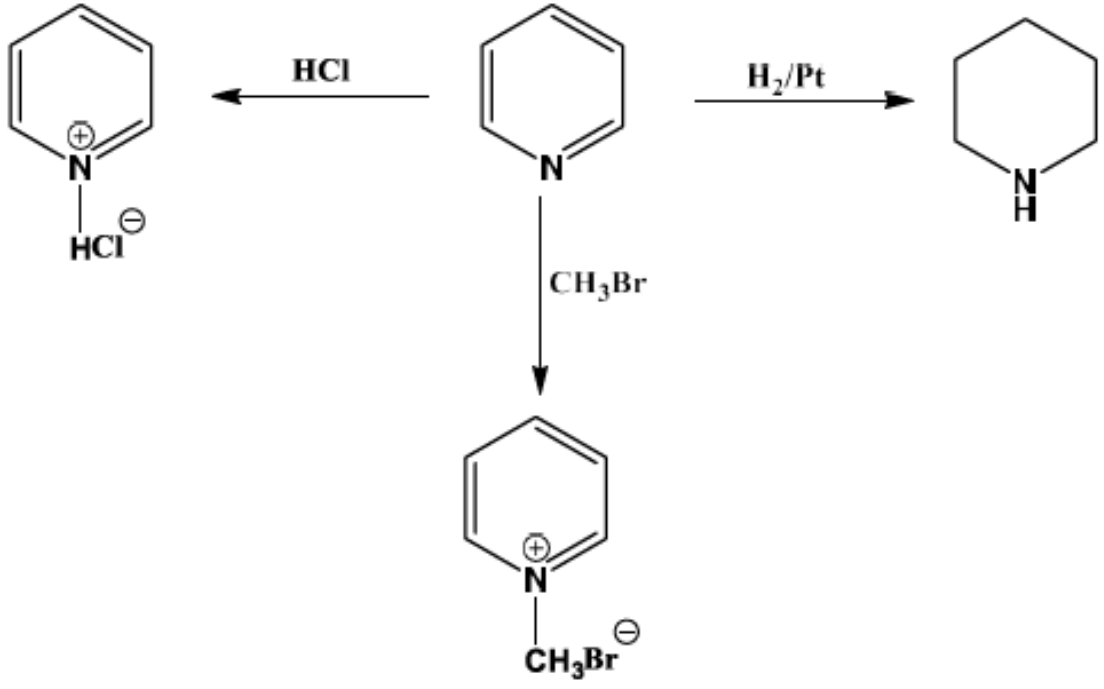


Reactions of pyridine

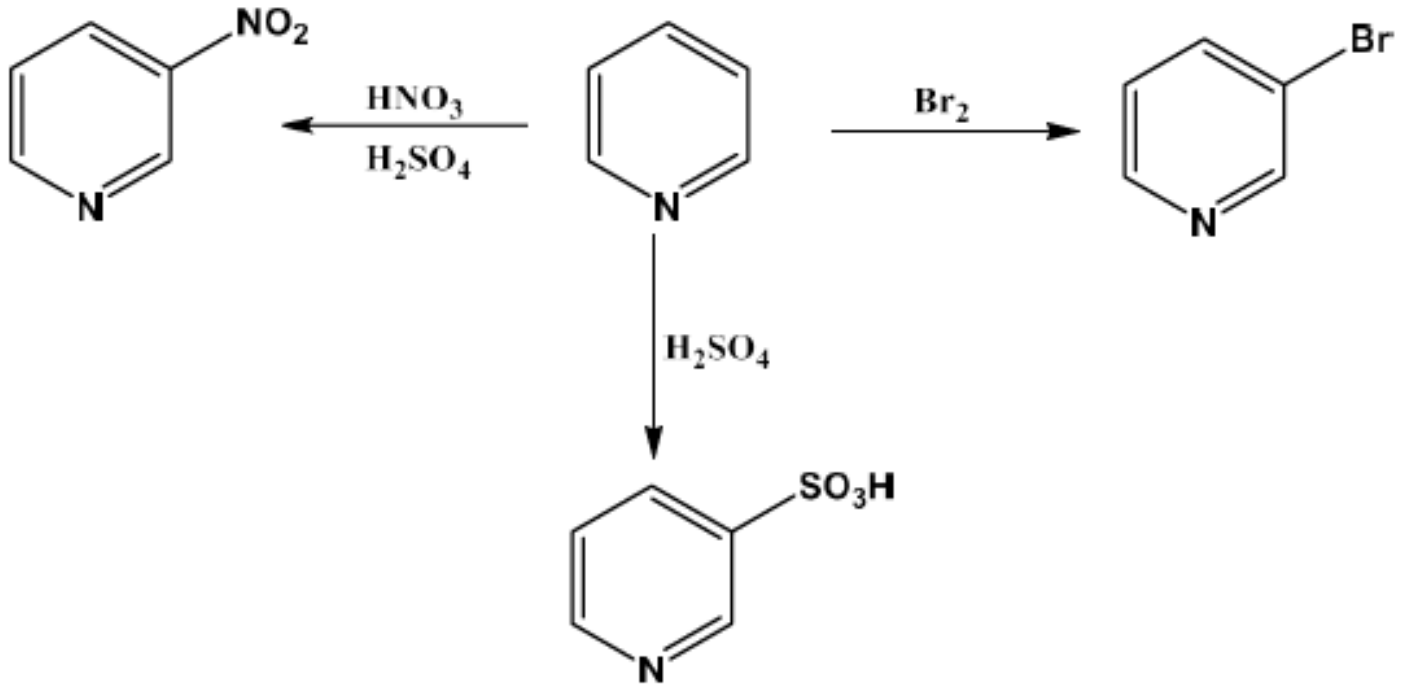
1- addition reactions:

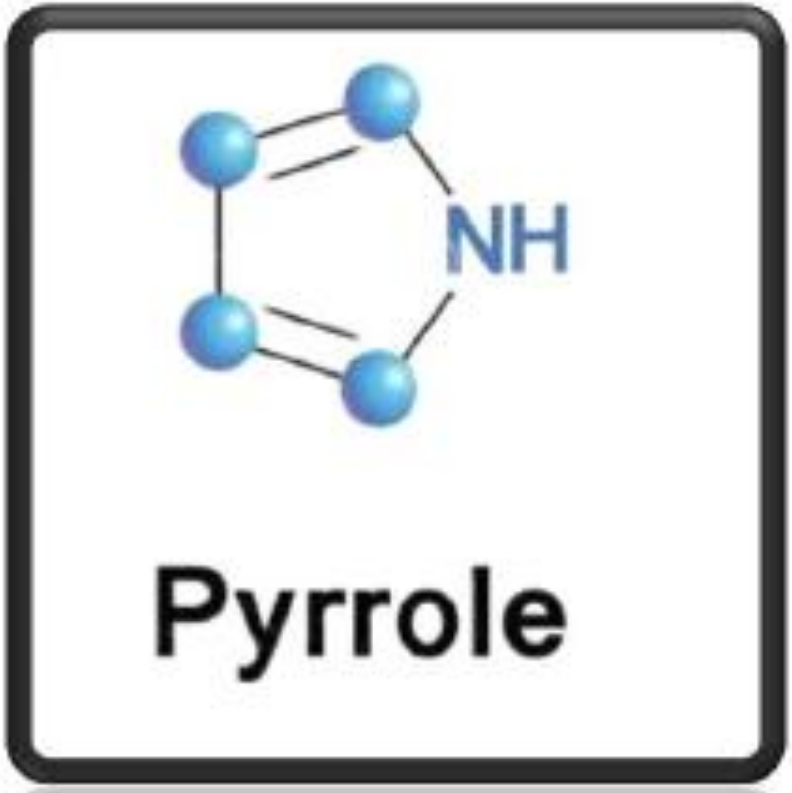
A- reduction

b- salt formation



Electrophilic substitution reactions:

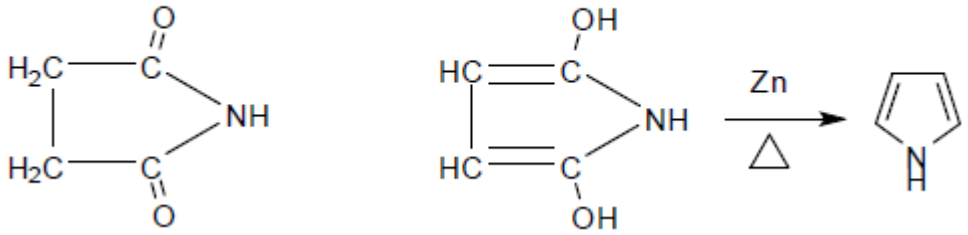




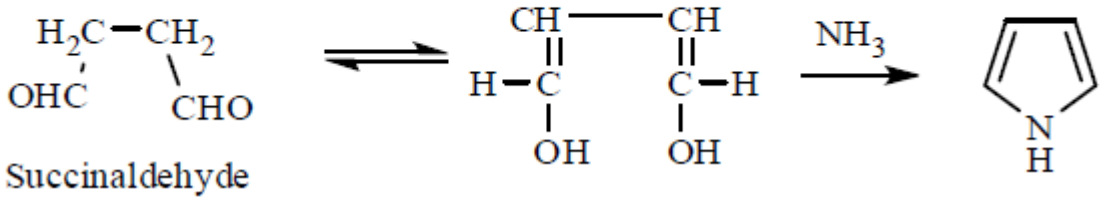
NH
Pyrrole

Synthesis Of Pyrrole

1. Distillation of succinimide with zinc dust



2. From Paal-Knorr synthesis

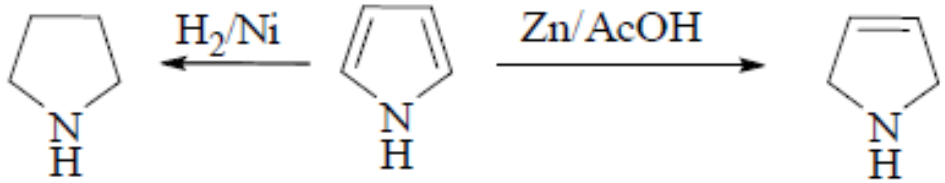


Succinaldehyde

Reactions Of Pyrrole

Addition reaction:

addition of hydrogen

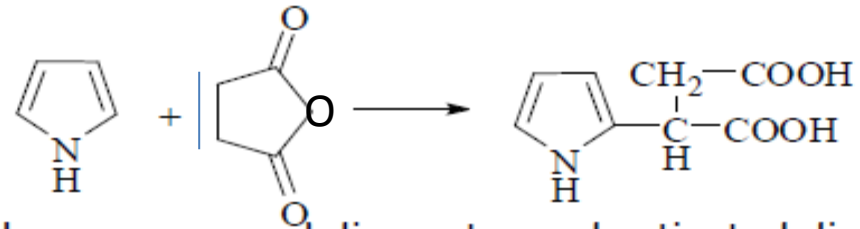


pyrrolidine (THP)

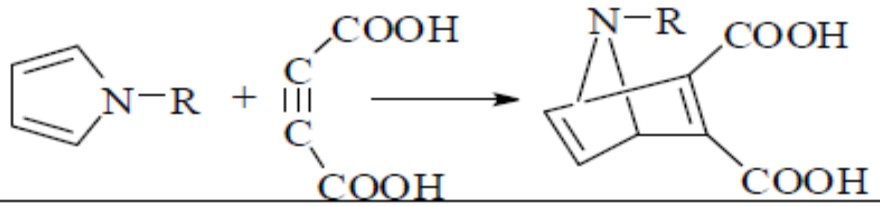
Pyrroline (2,5-dihydropyrrole)

b) Diels-Alder reaction

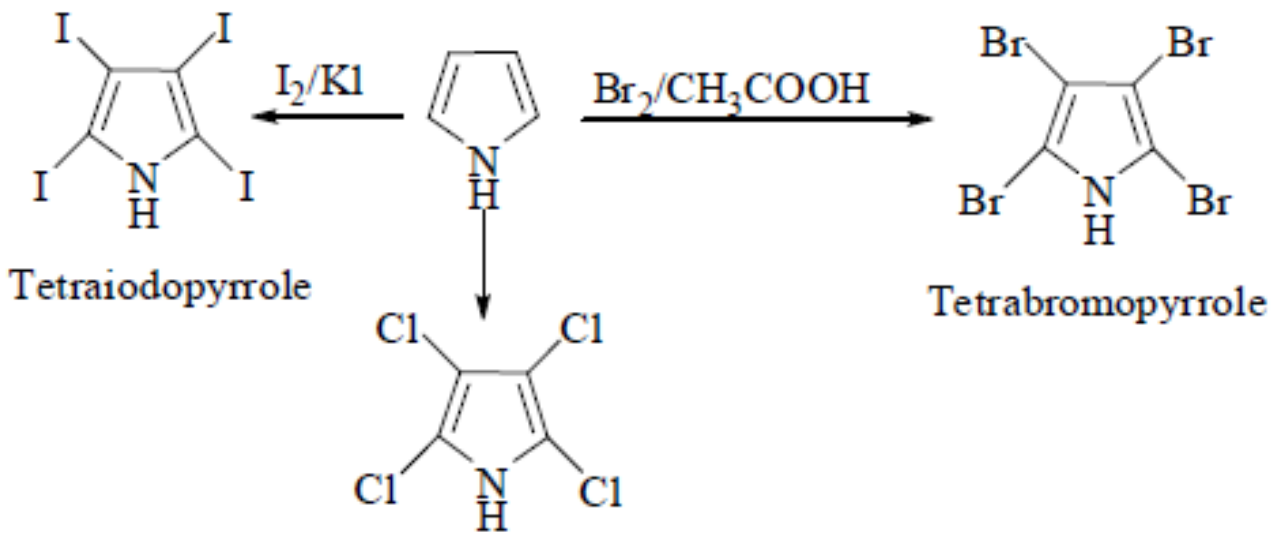
i. Pyrrole reacts with maleic anhydride, like Michael addition



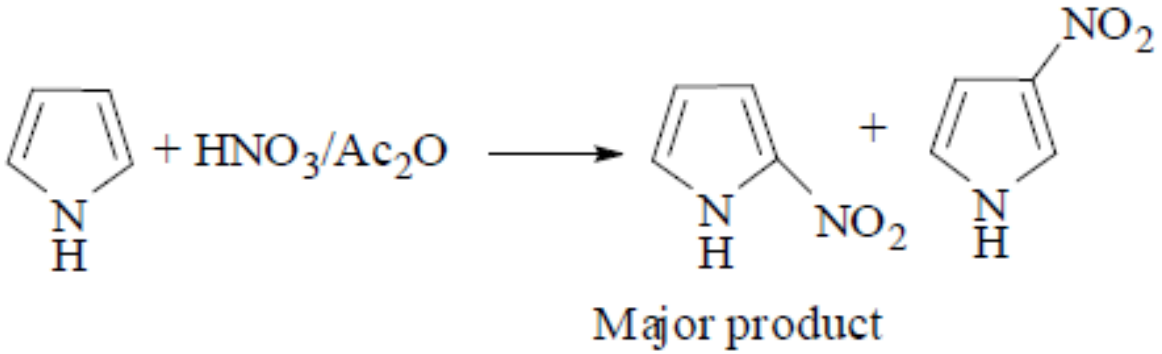
ii. N-alkylated pyrrole behaves as normal dienes toward activated dienophile via 2,5-addition to pyrroles



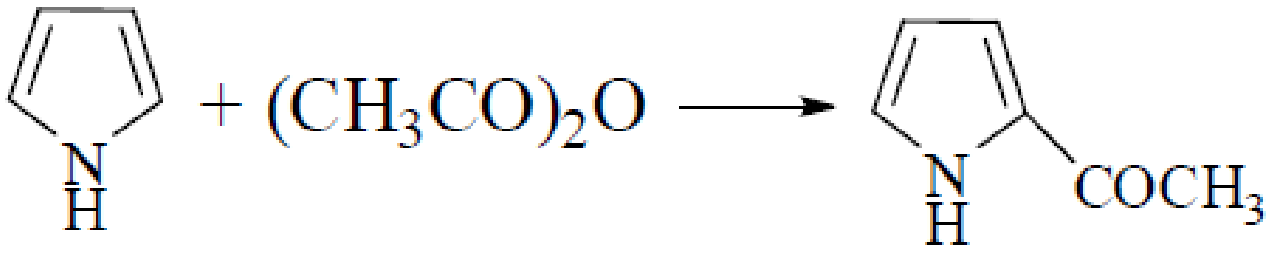
2. Halogenation:



3. Nitration:

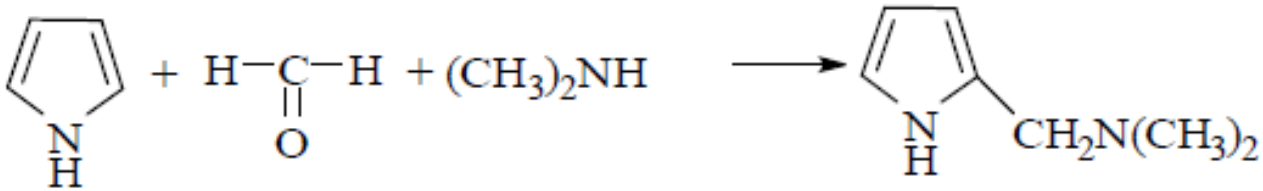


4. Friedel-Crafts:



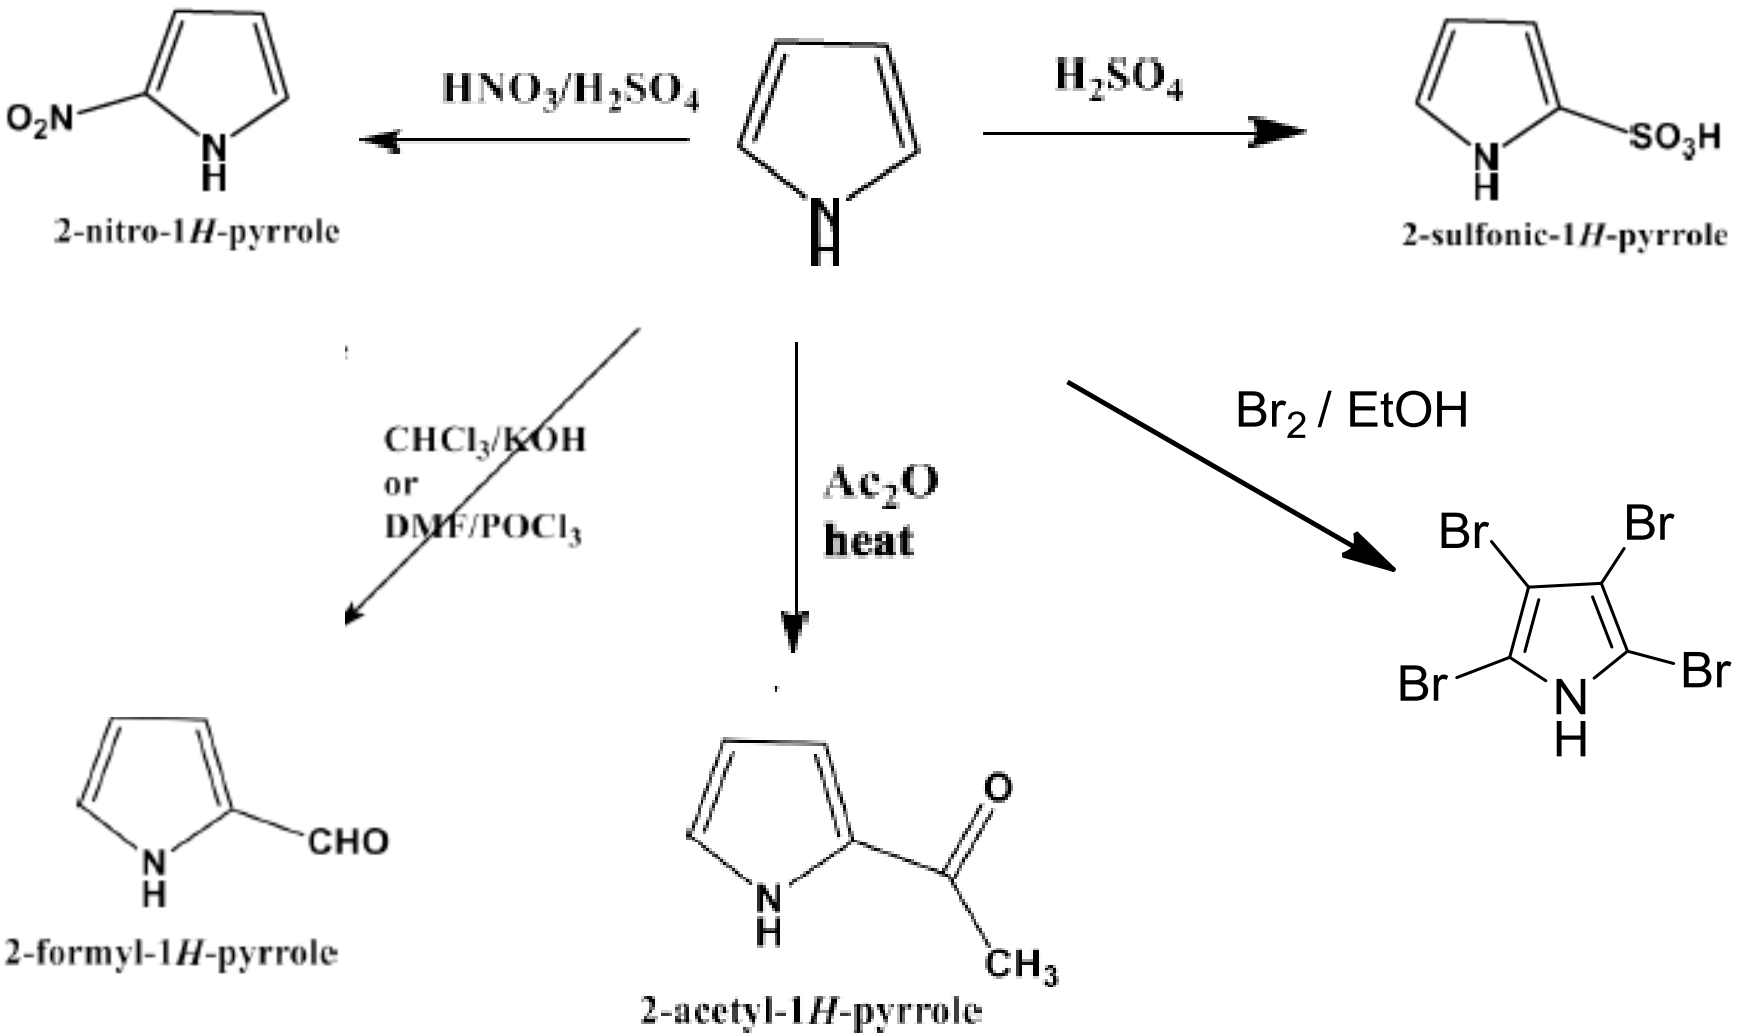
5. Mannich reaction:

Pyrrole reacts with formaldehyde and dimethyl amine yielding the Mannich bases

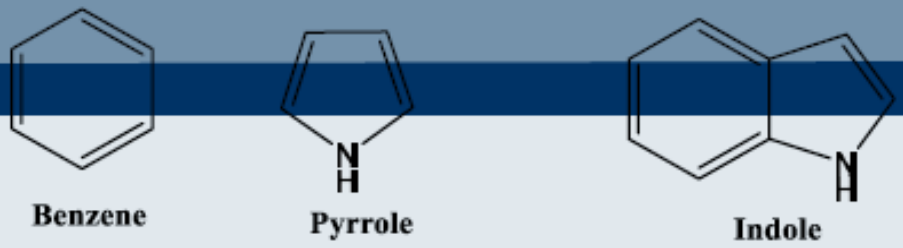


2-dimethylaminomethylpyrrole

Electrophilic substitution:

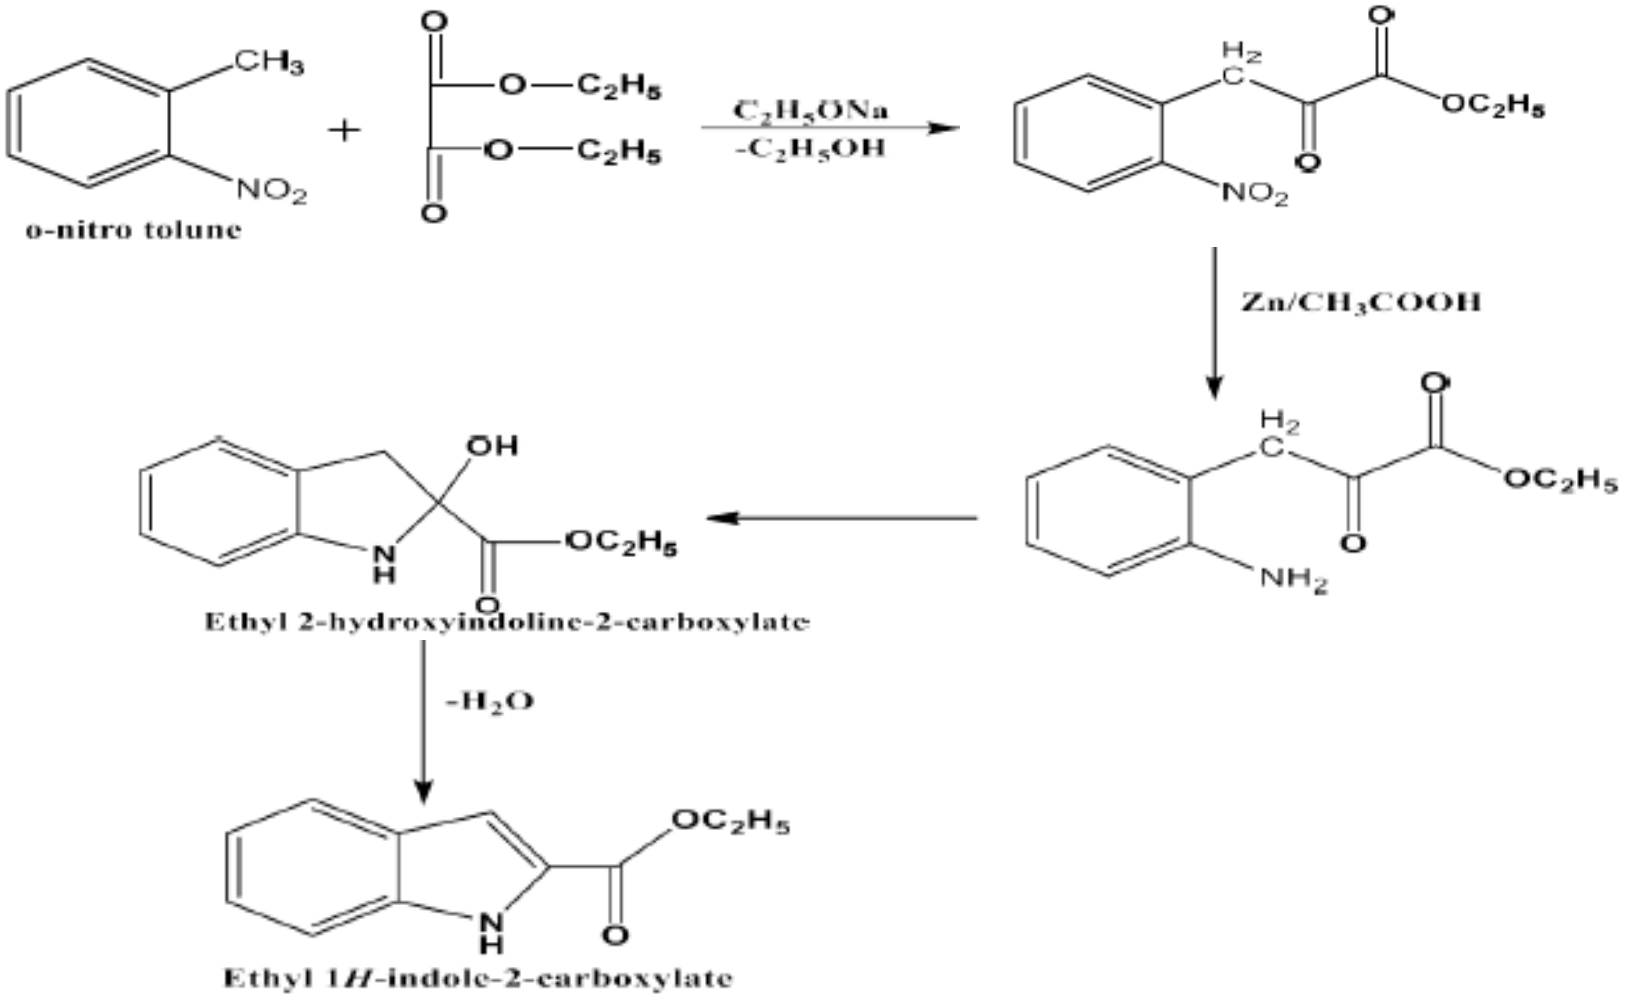


Indole



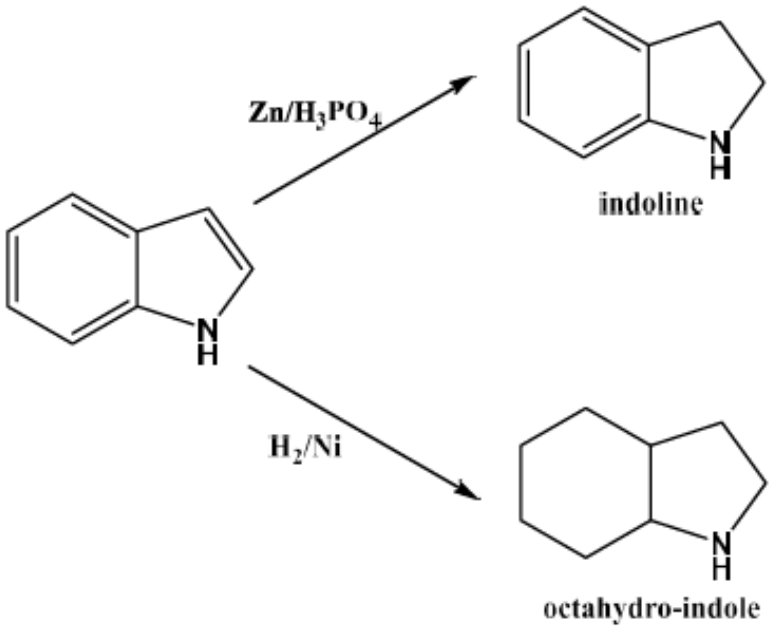
Preparation of indole

Reissert Synthesis



Reactions of indole

Reduction of indole:



Reactions of indole

Electrophilic substitution reactions:
